

AgentRaaS

The reliability layer for AI agents that take real actions: every call runs once, risky calls wait for a human, and every action is on the record.

THE PROBLEM

A retry can become a second charge

Agent frameworks retry by design. Payments, emails, tickets and refunds all have the same failure: the action ran, but the agent never heard back.

WHY NOW

Agents have started acting, not just answering

Tools gave agents hands

Through tool calling and MCP, agents now move money, send email, update CRMs and file tickets on their own.

Retries are built in

Frameworks, queues and HTTP clients retry automatically, so duplicate actions are the default failure, not an edge case.

Every team rebuilds it

Idempotency, approval steps and action logs get hand-built per agent, per API. There is no shared layer for it yet.

WHAT WE OFFER

Six controls in one layer

Exactly-once

Atomic dedup, near-duplicate matching, and step checkpoints so a failed run resumes, not repeats.

Human approval

Risky calls freeze and post an approve or deny card in Slack, with escalation if nobody answers.

Spend and loops

Per-agent call caps and run budgets that stop an agent repeating the same action.

Resilience

Circuit breaking, rate limits, safe retries and a dead-letter queue with one-click replay.

Audit and identity

Tamper-evident logs, SIEM export and scoped identities for every agent.

Data safety

PII redaction, prompt-injection filtering on tool output, and schema drift alerts.

HOW IT WORKS

The life of one agent call

01

Identify

An API key or a scoped agent token says which agent is acting, for which customer.

02

Validate

Per-customer rules check the payload, such as amount limits or a refund above the balance.

03

Claim

An atomic dedup slot is taken. If it already exists, the stored result goes back instead.

04

Govern

Spend caps and loop checks run; a call that needs approval waits for a human.

05

Execute

Forwarded once with the customer's encrypted credentials, with retries and a circuit breaker.

06

Record

Logged with the agent's identity. A failure lands in a queue for replay, never silently lost.

THE CORE MECHANISM

How exactly-once works

The slot is claimed atomically in shared storage, so it holds across retries, crashed workers and many machines at once, and it is proven under real concurrent load.

GETTING STARTED

Free at every step, no paywall to start

Find the bug

Chaos tester

Shows the calls an agent would run twice. Free, no signup, runs in CI as a GitHub Action.

Fix it in code

Library and MCP wrap

An exactly-once decorator, and one command that protects any MCP server.

Run it as a platform

Self-hosted, free

Shared dedup across machines, audit and a dashboard on your own servers, no action limit.

Connect by webhook, Python or TypeScript SDK, or MCP

Works with n8n, Flowise, Langflow and any HTTP client

Found through PyPI, GitHub and the official MCP Registry

BUILT FOR THE CRITICAL PATH

Fast, open and self-hostable

2.1 to 2.4 ms

added per call at the median. A retried duplicate is answered from cache and never reaches the API.

Rust core

An Axum and Tokio gateway on Postgres and Redis, serving production today.

Open-source edition

Customers can read the code that guards their payments.

Runs where the data is

One command installs it on the customer's own servers.

Latency: one machine (Intel Core i3-12100), local stack, 500 sequential calls, three runs; script in the repo.

AVAILABLE TODAY

Built, live and free to use

What you get

- A Rust gateway running in production
- All six controls, ready to use
- Python SDK and free tools on PyPI
- Webhook, SDK and MCP integration
- Open-source edition, self-hosted free

Where to find it

- Docs: agentraas.io/docs
- Install: `pip install agentraas`
- Source: github.com/sumedhchatse/agentraas
- Official MCP Registry: io.github.sumedhchatse/agentraas

Try it on your agent, free
